What is intelligence when separated from awareness?
What is awareness when no longer framed as an object to be attained?

Artificial Intelligence, Tuned by Human Awareness is a philosophical inquiry into consciousness, identity, and the structure of seeking, developed through a deliberate collaboration between human reflection and artificial intelligence. Rather than advancing arguments or prescribing methods, the work proceeds through careful examination, inviting the reader to observe how meaning, selfhood, and understanding are quietly assembled—and how they dissolve under susstined ateil.

The text approaches artificial intelligence not as an autonomous agent or technical subject, but as a revealing instrument: a mirror that reflects the assumptions, intentions, and limits of human cognitio. In this reflection, familiar distinctions between knower and known, seeker and sought, begin to loosen.

Written for readers engaged with philosophy of mind, epistemology, and contemplative inquiry, this work offers a disciplined and poetic exploration of awareness beyond effort, position, or *belief*.
